STOR 320.1 Modeling V

Introduction

- Now We Consider
 - Categorical Response Variables
 - Numerical/Categorical Explanatory Variables
- Focus is on Classification
- Read Chapter 4 in ISLR

Introduction

- Basic Case: Binary Response
 - Variable Has Two Possible Outcomes
 - Typically, Yes or No Responses to a Question
 - Example
 - Y = Who Will Win the 2020 Presidential Election?
 - Y = Did You Pass Your STOR 320 Class?
 - Y = What Factors Influence the Admission into Graduate School?

Scenario

- Question: Are Students Who Get Good Grades Likely to be Admitted to Graduate School?
 - Y = Would the Student be Admitted to a Graduate School?
 - X = College GPA
- Why is Linear Regression Inappropriate?

$$P(Admission|X) = \beta_0 + \beta_1 X$$

Problem Setting

Bernouilli Random Variable

$$Y = \begin{cases} 1 & if Yes \\ 0 & if No \end{cases}$$
$$p = E(Y) = P(Y = 1)$$

Sample n Students

$$Y' = \sum Y_i \sim Binomial(n, p)$$

$$\hat{p} = \frac{\sum y_i}{n}$$

Estimated Probability that a Student Would be Admitted to a Graduate School

• Analyze the Effect of X on $p: p = E(Y|X) \neq \beta_0 + \beta_1 X$

Logit Link

- Modeling the Mean
 - Logit Link Function

$$\log\left(\frac{p}{1-p}\right) = \beta_0 + \beta_1 X$$
Odds of Admission

- Understanding Odds
 - Odds of Admission = 1
 - Odds of Admission < 1
 - Odds of Admission > 1

Model Construction

• Solving for $\frac{p}{1-p}$

$$\log\left(\frac{p}{1-p}\right) = \beta_0 + \beta_1 X$$

$$\frac{p}{1-p} = e^{\beta_0 + \beta_1 X}$$

Odds of Admission Given the Student's GPA

Solving for p

$$p = e^{\beta_0 + \beta_1 X} - p e^{\beta_0 + \beta_1 X}$$

$$p(1 + e^{\beta_0 + \beta_1 X}) = e^{\beta_0 + \beta_1 X}$$

$$p = \frac{e^{\beta_0 + \beta_1 X}}{1 + e^{\beta_0 + \beta_1 X}}$$

Probability of Admission Given the Student's GPA

Logistic Regression for Classification

• Recall:
$$Y = \begin{cases} 1 & if Yes \\ 0 & if No \end{cases}$$

- After Getting Data, We Estimate
 - $\hat{\beta}_0$
 - $\hat{\beta}_1$

$$\hat{p} = \frac{e^{\hat{\beta}_0 + \hat{\beta}_1 X}}{1 + e^{\hat{\beta}_0 + \hat{\beta}_1 X}} \implies$$

Estimated Probability of Admission Given the Student's GPA

- Two Scenarios
 - $\hat{p} < 0.5 \implies \hat{Y} = 0$
 - $\hat{p} > 0.5 \implies \hat{Y} = 1$

Evaluating the LR Model

- Two Methods
 - Leave Out Data Intentionally
 - Use Cross-Validation
- Positives and Negatives
 - True Positive = Predicted an Admission and the Student Got Admitted
 - False Positive=Predicted an Admission and the Student Didn't Get Admitted
 - False Negative = Predicted a Student Wouldn't be Admitted and They Did Get Admitted
 - True Negative = Predicted a Student Wouldn't be Admitted and They Didn't Get Admitted

Confusion Matrix

Confusion Matrix

	Predicted		
Actual	Will be Admitted	Won't be Admitted	
Admission	n_{11}	n_{12}	
Isn't Admitted	n_{21}	n_{22}	

• Sensitivity:

$$n_{11}/(n_{11}+n_{12})$$

Specificity:

$$n_{22}/(n_{21}+n_{22})$$

False Positive Rate:

$$n_{21}/(n_{21}+n_{22})$$

False Negative Rate:

$$n_{12}/(n_{11}+n_{12})$$

Titanic: Data

Titanic Survival Data

> library(titanic)

Response Variable

$$Y = \begin{cases} 1 & \text{if Survived} \\ 0 & \text{if Did Not Survive} \end{cases}$$

- Explanatory Variables
 - Passenger Class
 - Sex
 - Age
 - Siblings/Spouses Aboard
 - Parents/Children Aboard
 - Passenger Fare
 - Port of Embarkation

Titanic: Data

- Titanic Survival Data (Continued)
 - Selecting Variables of Interest

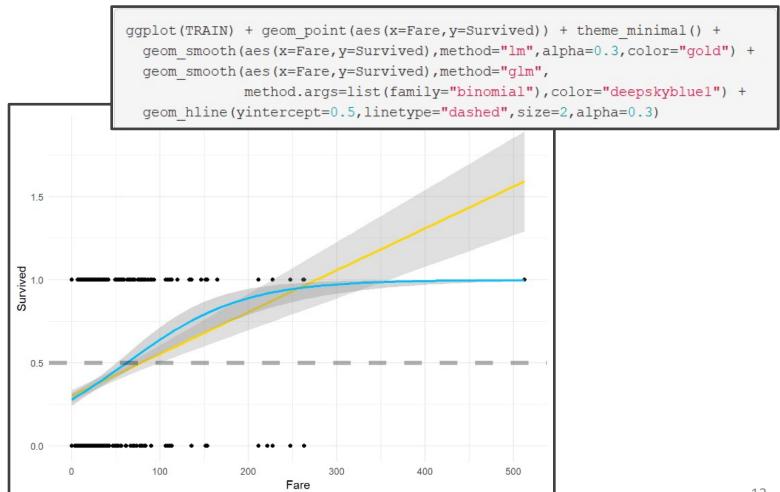

```
> TRAIN=titanic_train[,c(2,3,5,6,7,8,10,12)]
> TEST=titanic_test[,c(2,4,5,6,7,9,11)])
```

Glimpse of Data
